V4 Adding default constraint

03 April 2016   04:36

1. Default constraints are used to insert default value in certain column when no value is inserted for any record into that column and that column except NULL.
2. Like instead of NULL being inserted for any column I want default value as '3'.
3. User will not insert anything for that column but default value 3 will get inserted.
4. `Alter table tableName add constraint constraintName default DefaultValue for ExistingColumnName`
5. To Add a new column and add default constraint along with it use :
   `Alter table TableName ADD columnName dataType Null/NotNull Constraint constraintName Default (defaultValue)`
6. Constraint meaning = a limitation or restriction.
7. If we deliberately inserts NULL value for any column with default constraint, than NULL only will be inserted.
8. TO drop any default constraint use :
   `Alter table tableName`
   `Drop Constraint constraintName.`
